

# Meteorite Collections: Sample List

Institute of Meteoritics  
Department of Earth and Planetary Sciences  
University of New Mexico

January 8, 2008

The University of New Mexico

# Institute of Meteoritics Meteorite Collection

The IOM meteorite collection includes samples from approximately 600 different meteorites, representative of most meteorite types. The last printed copy of the collection's Catalog was published in 1990. We will no longer publish a printed catalog, but instead have produced this web-based Online Catalog, which presents the current catalog in searchable and downloadable forms. The database will be updated periodically. The date on the front page of this version of the catalog is the date that it was downloaded from the worldwide web. The catalog website is: [http://epswww.unm.edu/metcat/metcat\\_entry.php](http://epswww.unm.edu/metcat/metcat_entry.php)

Although we have made every effort to avoid inaccuracies, the database may still contain errors. Please contact the collection's Curator, Dr. Rhian Jones, ([rjones@unm.edu](mailto:rjones@unm.edu)) if you have any questions or comments.

## Cover photos:

Top left: Thin section photomicrograph of the martian shergottite, Zagami (crossed nicols). Brightly colored crystals are pyroxene; black material is maskelynite (a form of plagioclase feldspar that has been rendered amorphous by high shock pressures). Photo is 1.5 mm across. (Photo by R. Jones.)

Top right: The Pasamonte, New Mexico, eucrite (basalt). This individual stone is covered with shiny black fusion crust that formed as the stone fell through the earth's atmosphere. Photo is 8 cm across. (Photo by K. Nicols.)

Bottom left: The Dora, New Mexico, pallasite. Orange crystals of olivine are set in a matrix of iron, nickel metal. Photo is 10 cm across. (Photo by K. Nicols.)

Bottom right: Thin section photomicrograph of a chondrule in the carbonaceous (CV3) chondrite, Allende (crossed nicols). The chondrule contains bars of brightly colored olivine. The black material surrounding the chondrule is the fine-grained silicate-rich matrix of the chondrite. Photo is 1 mm across. (Photo by R. Jones.)

## CHONDRITES
